

Zomato Revenue Analysis

Prepared By:
Nick Wright

Tools Used:
PostgreSQL • DBeaver • SQL • Power BI

Date:
May 2026

Executive Summary

This project analyzed Zomato marketplace performance using SQL, PostgreSQL, and Power BI to identify key revenue drivers, customer behavior patterns, geographic trends, and restaurant performance insights.

Raw CSV datasets containing orders, restaurant information, and menu data were imported into PostgreSQL using DBeaver, where the data was cleaned, validated, and transformed into a structured relational model for analysis. The finalized dataset was then connected to Power BI to develop an interactive executive dashboard.

The analysis focused on revenue trends, order volume, customer ratings, average order value (AOV), and geographic performance. Results showed that revenue is broadly distributed across restaurants and cities, while order volume appears to be a stronger overall revenue driver than AOV. Higher-performing restaurants also tended to cluster between ratings of 3.5 and 4.5, suggesting a moderate positive relationship between customer satisfaction and revenue performance.

Additionally, unusually low weekend transaction volumes indicated potential limitations in weekend transaction coverage within the dataset.

Overall, the project demonstrates how SQL-based data preparation and Power BI visualization can transform raw transactional data into actionable business intelligence insights.

Data Preparation & SQL Workflow

Raw CSV datasets containing orders, restaurant information, and menu data were imported into PostgreSQL using DBeaver to create a structured relational database for analysis.

The SQL workflow included:

- validating imported records,
- removing duplicate and unnecessary fields,
- standardizing schema relationships,
- resolving data type inconsistencies,
- and preparing the data for business intelligence reporting.

Key preparation steps included:

- removing duplicate menu identifiers,
- restructuring restaurant relationships,
- handling inconsistent menu pricing formats,
- and validating transaction integrity across tables.

The finalized dataset was then connected to Power BI to support dashboard creation, KPI development, and business analysis.

Zomato Executive Performance Dashboard

Total Revenue

\$881M

Total Orders

2M

Average Order Value

\$380

Average Rating

3.9

Top Restaurant Brands by Revenue

Monthly Revenue and Order Trends

Revenue is broadly distributed across cuisines and cities, with order volume emerging as a stronger revenue driver than AOV overall. Higher-performing restaurants tend to cluster between ratings of 3.5 and 4.5, suggesting customer satisfaction moderately supports revenue growth.

Top Revenue-Generating Restaurants

Revenue Share of
Top 10 Restaurants

2.3%

Total Restaurants

98K

The top 10 restaurants generate only 2.3% of total revenue, indicating a highly fragmented restaurant market.

Top Revenue-Generating Cuisines

Revenue Share of
Top Cuisine

6.1%

Total Cuisine
Categories

1K

No single cuisine dominates the market, with the top cuisine contributing only 6.1% of total revenue despite leading all categories.

Revenue & Order Trends Over Time

Monthly Revenue and Order Trends

Total Revenue

\$881M

Total Orders

2M

Revenue and order volume fluctuated throughout the year, with strong rebounds in October and November following a September decline.

Weekday vs Weekend Revenue & Order Trends

Monthly Revenue and Order Trends

Weekday Orders Weekend Orders Total Revenue

Total Revenue

\$881M

Total Orders

2M

Contrary to the hypothesis, weekday orders consistently exceeded weekend orders. The unusually low weekend volumes suggest incomplete weekend transaction coverage within the dataset.

Top Revenue-Generating Cities

Revenue Share of
Top 3 Cities

11.1%

Total Cities

806

Revenue is broadly distributed across cities, with the top 3 cities contributing only 11.1% of total revenue.

Revenue Drivers: Order Volume vs AOV

Revenue vs Order Volume

Revenue vs Average Order Value

Total Revenue

\$881M

Total Orders

2M

Average Order Value

\$380

Revenue appears more closely tied to order volume overall, while high-AOV restaurants create notable high-revenue outliers.

Revenue Drivers: Ratings & Revenue Performance

Average Rating

3.9

Revenue from 4★+
Restaurants

182.2M

% Revenue from
4★+ Restaurants

20.7%

Most high-performing restaurants cluster between ratings of 3.5 and 4.5, indicating a moderate positive relationship between customer ratings and revenue.

Conclusions

The analysis revealed several key insights into Zomato marketplace performance.

Revenue was broadly distributed across restaurants and cities rather than concentrated among a few businesses.

Order volume showed a stronger relationship with revenue generation than average order value (AOV), although some high-AOV restaurants still produced strong revenue performance.

Higher-performing restaurants also tended to cluster between ratings of 3.5 and 4.5, suggesting a moderate positive relationship between customer ratings and revenue. Additionally, weekday transaction activity consistently exceeded weekend activity, likely reflecting incomplete weekend data coverage within the dataset.

Business Recommendations

1. Prioritize Order Frequency Growth

Since revenue appears more strongly tied to order volume than AOV, Zomato should prioritize strategies that increase transaction frequency, including loyalty incentives, repeat-order promotions, and customer retention campaigns.

2. Support High-Performing Restaurants

Restaurants with ratings between 3.5 and 4.5 consistently showed stronger revenue performance. Zomato could improve marketplace performance by increasing visibility and promotional support for highly rated restaurants.

3. Improve Data Quality Monitoring

The unusually low weekend transaction counts suggest possible gaps in dataset coverage. Implementing additional data validation and monitoring processes would improve confidence in behavioral trend analysis.

4. Expand Geographic Growth Opportunities

Because revenue distribution remained relatively diversified across cities, Zomato may benefit from continued expansion and localized marketing strategies rather than relying heavily on a small number of dominant markets.

Final Takeaway

This project demonstrates how SQL-based data preparation and Power BI visualization can transform raw transactional data into actionable business intelligence insights capable of supporting operational, marketing, and strategic decision-making.
